DATABASE INDEXING

"Concept && Coding" YT Video Notes

Database Indexing:

(RDBMS)

Monday, 25 September 2023 1:23 PM

Few things we have to understand first, before we see how indexing works.

1. How Table data (rows) are actually stored?
2. What type of indexing present?
3. Understanding the data structure used for indexing and how it works?

Then we will combine all and see how actually the DBMS do the indexing....

Let's Start...

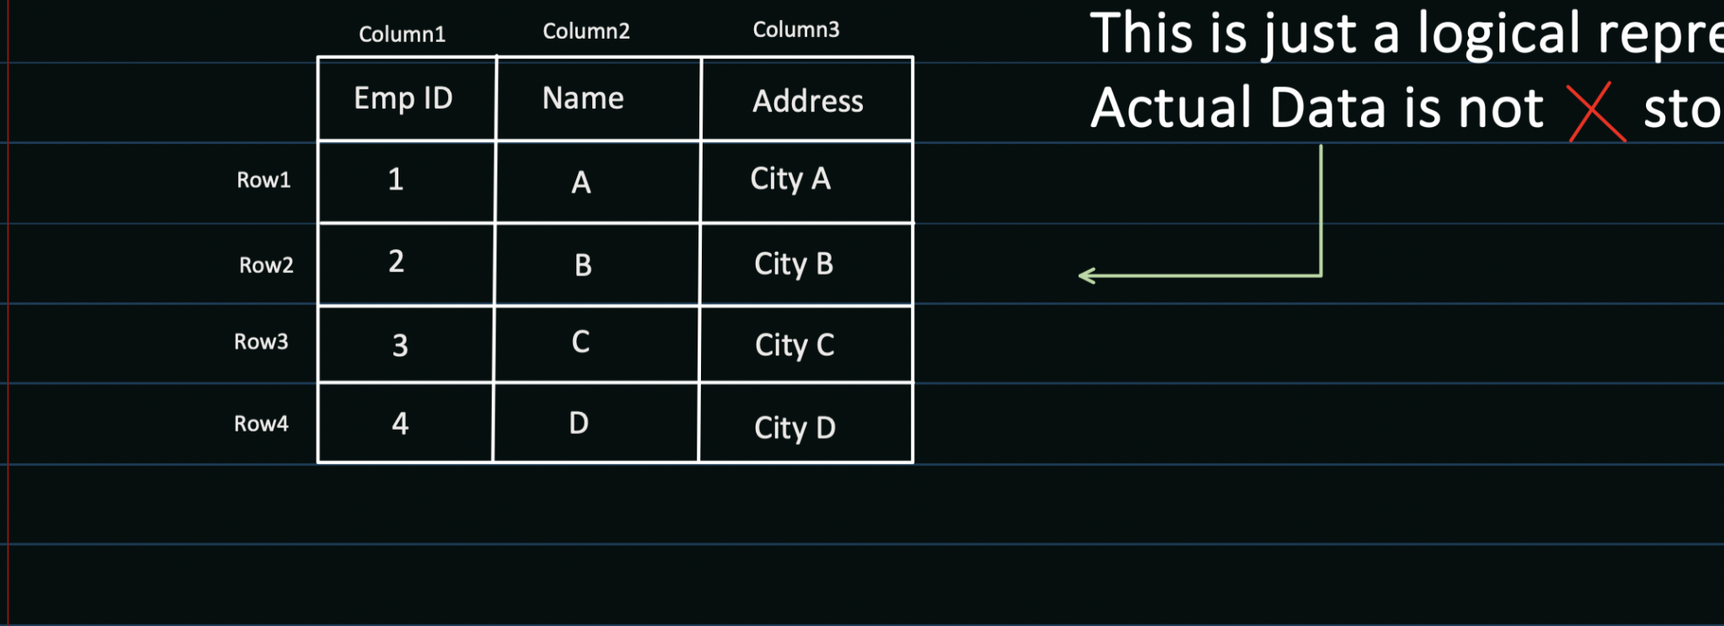

1. How Table data is actually stored?

	Column1	Column2	Column3
	Emp ID	Name	Address
Row1	1	A	City A
Row2	2	B	City B
Row3	3	C	City C
Row4	4	D	City D

This is just a logical representation.
Actual Data is not ✗ stored in this way.

- DBMS creates Data Pages (generally its 8KB but depends upon DB to DB)
- Each Data Page can store multiple table rows in it.

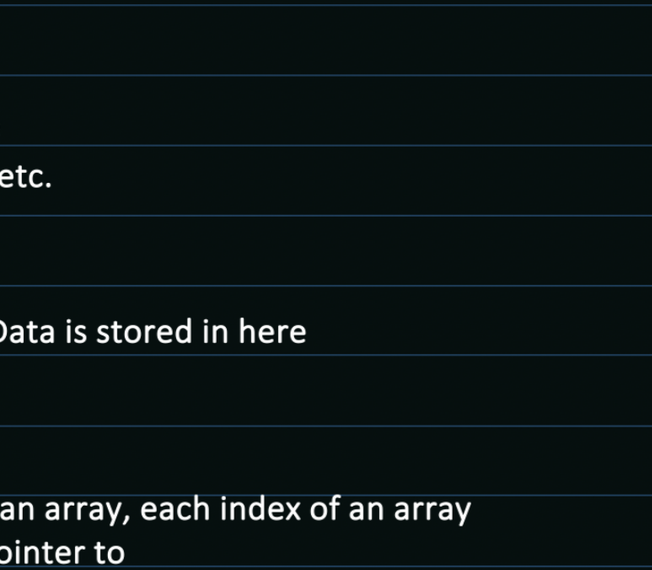

Just an example of Data page.

So if 1 table row is lets say 64Bytes, so in 1 data page we can have ~125 DB rows

	Column1	Column2	Column3
	Emp ID	Name	Address
Row1	1	A	City A
Row2	2	B	City B
Row3	3	C	City C
Row4	4	D	City D

64Bytes
